2026 BABY MOOS

These micro miniature calves represent an extraordinary level of care, planning, and investment. Howe Ranch have recently invested over $68,000 into our current group — including the newborns. This investment reflects years of intentional breeding through highly selective, elite embryo transfer programs designed to produce truly miniature, well-tempered Highland calves. Exceptional calves like Sugarplum and Pippi are the result of carefully curated genetics, chosen for their exceptionally small size, signature softness, and gentle disposition.

She is an embryo transfer baby from very high-end micro Highland genetics — her sire is Yeti, one of the most sought-after micro bulls in the country (located in Nebraska), and her dam comes from an elite embryo program. She's incredibly small, extremely fluffy, and has the sweetest, most gentle personality

She's a micro mini Highland × Hereford heifer, just born in February, and stands just about 20 inches tall. Her mom is a 35" micro mini Hereford (British mini cattle), and her dad is a 39" yellow mini Highland — a beautiful combination of two exceptional Heritage lines. She is the calmest, sweetest little calf we've ever had.

This tiny calf is out of a micro Dexter bull and micro Zebu dam, standing just 20" tall. Zebu are hardy, heat-tolerant cattle from South Asia, and Mini Dexters are a gentle, compact heritage breed from Ireland—together creating a uniquely small, calm, and special little calf like Bambi.

2026 BABY MOOS CONT.

You want the tiniest micro calf we have ever seen? Meet Tarnickel, out of the farmous Bull Daddy's Money (super hairy micro Highland) and Y80, a gorgeous micro Highpark cow, both from Nelson Livestock in Brock, NE. Tarnickel is famous for curling up and dozing off right in his guests' laps! This sweet little nugget happily sips milk bottles nearly as big as he is.
